

It is the concept of Binomial distribution to find the mean,variance,standard deviation,moments and skewness using the jupyter notebook. I took number of trails as n=20,probability success as p=0.05 and target success 1and I got the PMF graph and I observed how PMF graph changes for every different number of trails . I understood how the binomial distribution works. The vertical axis in graph shows the probability p(x) and the horizontal axis shows the number of successes (x) .In this case mean is 1,variance is 0.95 and standard deviation is 0.9747 and p(x=1)=0.3774
